

Implementing Electronic Government?

Netramedia can help

The Government required every local authority to produce an Implementing Electronic Government Statement (IEG Statement). Netramedia and their partners can work with you to deliver your services electronically and define the strategic steps you can take to ensure fulfilment of the 2005 target.

Management Information Systems (Intranet / Extranet)

Extranet systems can help build partnerships between authorities, with suppliers and to support multi-agency working. Information and other services can be provided online, giving citizens new and more flexible means to interact with government. And through better information exchange, local government communities can combat duplication of effort and thus make better use of precious resources.

Our bespoke information management systems can ensure systematic and efficient collaboration between individuals, departments and partners across the entire local government community, thereby reducing operating costs and maximizing human resources.

Intranet solutions can contain all documentation - from standard application forms to engineering drawings - which can be consistently managed, stored and accessed in a secure, electronic environment.

Content management solutions

Web sites of large, diverse and fast-growing organizations are difficult to maintain without the use of content management systems. These systems can remove bottlenecks in web delivery and enable organizations to deliver engaging and dynamic content. We implement powerful content management systems based on either off-the-shelf or bespoke software products.

Electronic records management Solutions

Under the terms of the Freedom of Information Act and the Data Protection Act, all Government bodies are legally bound to quantify all the information they hold on individuals, and maintain that information securely. Records of business decisions and transactions must also be kept to meet the demands of corporate accountability.

Electronic records management (ERM) solutions meet these kinds of needs. With these systems,

governmental bodies are able to account for all records and transactions held within their systems accurately, reliably and automatically.

Citizen Interaction Solutions

One of the key goals of e-Government is to enable citizens to interact with government more effectively. Using the web not only gives citizens

more flexibility but also can help government operate more cost-efficiently, by removing the need to dedicate staff to answering queries on the telephone or in person.

Collaboration Solutions

Manage partnerships cost-effectively
Collaboration with external partners or between geographically dispersed departments can be a time-consuming process. Keeping each interested party consistently up-to-date with amendments and discussions is no easy feat.

Netramedia can minimize the complexity associated with managing projects - from bids to ongoing projects such as the management of waste disposal services. Online workspaces enable interested parties to access all relevant project documentation - including ongoing email discussions - in a secure, password-protected environment.

Netramedia bespoke e-government solutions enable you to:

- >> Enhance your relationships with citizens and partners
- >> Store and maintain up-to-date records
- >> Streamline internal processes
- >> Ensure operational consistency across all departments
- >> Reduce operating costs
- >> Provide all employees with instant access to relevant information, expert
